Recommended laying method

A major advantage of Coronet Turf is the large area covered by each roll of turf many fewer joins than traditional turf. For optimum speed and accuracy when laying Coronet Turf, the following pattern is advised; several teams can be employed at the same time by adopting this method.

When joining the turfs DO NOT overlap the joined edges and DO NOT create tension so that the joints pull apart.

CORRECT

WRONG

Work from boards laid on the turf already in position. When laying, remember the turf is easily cut and blended together - any really doubtful spots with which you are unhappy, cut out and replace with an offcut. It will grow together and blend in. Water the prepared soil to saturation point 48 hours before laying the turf.
